

Adaptive Application

CONFIGURED FOR APPLICATION ON POTATOES

• AUTONOMOUS WATER + NUTRIENT DELIVERY SYSTEM

360 RAIN is an adaptive application system that includes an autonomous machine, exclusively engineered infrastructure, and app-based control.

The system autonomously delivers water and nutrients throughout the season while you adapt input selection, application rates, and timing to fit your operation.

See how it works at 360RAIN.ag

In potatoes, the 360 RAIN machine runs autonomously delivering water and nutrients during all growth stages along pathsets created from the planter pass. That means you can cover every acre including the corners, odd shaped fields, hilled ground, and around obstacles.

AUTONOMOUS MACHINE

The machine is configurable for your potato operation with reel height above the canopy, 34-36" row spacing options, and various boom widths. No more dragging hose lines, resetting guns, or midnight shifts to move pipe.

EXCLUSIVE INFRASTRUCTURE

Configurable panels and stations exclusively designed for 360 RAIN manage the movement and control of data, water, and nutrients across the system, including the ability to inject UAN, potassium, and micronutrients.

APP-BASED CONTROL

The 360 RAIN app puts you in control of inputs, rates, and timing remotely allowing irrigation labor needs to be significantly reduced.
